glaze Robotic Window Cleaner Quick Guide

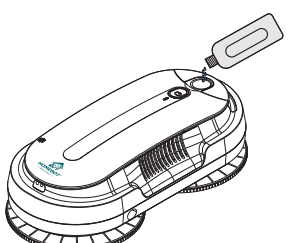

Preparing your windows

Start with windows that are free from heavy grime, dust and dirt. Robot window cleaners are designed for regular maintenance rather than deep cleaning. Once your robot is in routine use, you won't need to deep clean again.

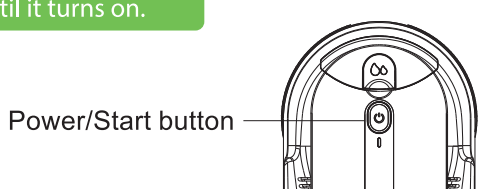

1) Take your robot out of the box and connect the plug lead.

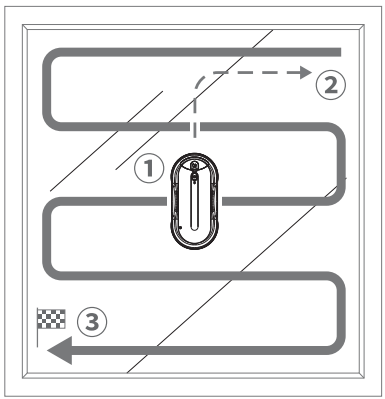

2) For best results, fill the liquid tank with HomeBot window cleaning solution.

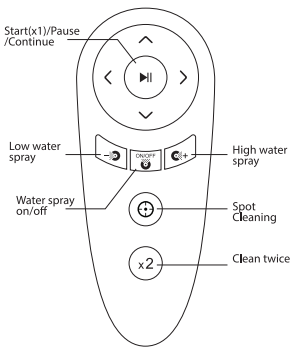

3) Press and hold the power button until it turns on.

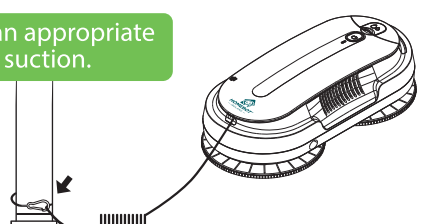

4) Once turned on, hold your robot to your window or mirror and it will automatically suction to it.

5) Tie your safety rope at an appropriate length in case of loss of suction.

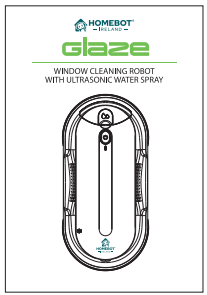

6) Press the power button again and your robot will begin to find the top corner .

7) Clean spray nozzles at the end of each use with cotton buds.

8) When it's not in use, empty the cleaning solution out and lightly rinse the tank with fresh water.

Tips & tricks

- Clean mops give the best results, so wash them regularly.
- For stubborn stains or heavy dirt, spray HomeBot window cleaner directly onto the glass before starting your robot.
- Very dusty windows may need two passes. Run a normal clean first, then fit fresh dry mops and let the robot buff the glass with the water setting off to prevent streaks.
- Take the robot off the window as soon as it finishes to avoid suction marks.

Warnings

- ⚠ If there is a power cut, the backup battery keeps the robot suctioned to the glass for 20 minutes.
- ⚠ Never fit wet mops. Excess moisture reduces suction and can cause the robot to slide.
